

FIND CAVITIES WITHOUT ANY RADIATION

Ask your dental provider about getting a DEXIS CariVu™ examination.

“

When I was pregnant, a no radiation solution to my dental exams was very important to me. And, now that my kids are older, I'm confident knowing they are getting the care they need without any unnecessary radiation. -Kristina R., mother of two

”

How does DEXIS CariVu find cavities without any radiation?

DEXIS CariVu uses near-infrared transillumination light to illuminate the tooth from the bottom up. This allows the dental practitioner to see inside the tooth. Healthy tooth structure will appear translucent while decay blocks the light, appearing dark.

How long does a CariVu exam take?

The exam itself is fast, easy, and painless. The two flexible arms of the device gently hug the teeth, gliding from tooth to tooth in just a few minutes.

How is CariVu different than an X-ray?

Besides using no radiation, CariVu can enable clinicians to:

- Identify cracks/fractures
- Spot cavities between teeth or around braces or fillings
- Detect cavities early
- Utilize minimally invasive treatment
- Save healthy tooth structure
